Risk Facilitation Service

Team based risk assessment is an effective way to capture and assess risks in order to produce risk profiles. Unfortunately some risk assessment activities are poorly lead or facilitated and are below standard causing them to be ineffective. High quality risk facilitation is essential to ensure the best possible outcomes from time consuming team-based risk workshops.

A **Context Interview** involves a one on one discussion with company officers in order to understand the assignment, the organisation, establish the risk context or other risk management activity.

A **Meeting Facilitator** structures a participative agenda. The facilitator acts as process expert (sometimes also content), asks for input on selected issues, allows other people to make presentations, leads a meeting that achieves its state purpose and encourages full member participation.

A **Risk Workshop Facilitator** guides and assists the risk assessor team in achieving the clearly defined workshop outcomes. The risk workshop facilitator is a process expert, who selects tools (FTA, ETA, HAZOP, FETA, Bowtie Analysis, FMEA, BIA) and decides when to use them, along with other preventions and interventions, depending on the type of risk workshop being conducted.

A **Developmental Facilitator** is a training role using facilitation techniques. This facilitator runs a "Train the Facilitator Workshop". Attendees get direct experience at developing facilitator skills in a risk-related context and caring environment.

A **Capability Development Facilitator** is the person charged with developing a risk management system capability for an organization. This involves the development of: systems; documentation of policy, standards, and guidelines; training packages; information management database and facilitating the implementation and training of staff.

A **Capability Enhancement Facilitator** is essentially a value adding auditors role. Facilitative audits involve active transfer of the knowledge gained during the auditing process to add value to their client. Auditing has become a highly interactive process that involves regular debriefings to the client, and sometimes additional bench marking services.
